Good afternoon, Peter and Jeff please see my report, Jeff I don't have much to show you, please read my report and let me know if you have any questions, if you like to come and see the trials you are welcome anytime, if you need more info let me know. Thank you.

Wood fiber trials

Wood fiber performed well, plants grew fine, good rooting, color and roots, we run our trial side by side with our regular mix, we do not see much benefit of the wood fiber, here are our observations

100% wood fiber

We shifted 5 different varieties in 1 gls, we did the trial side by side with our regular mix, the shifting was done on 03/30/2026

- A. Plants performed the same no difference on rooting, grow or color
- B. We did see a difference on one variety calamagostries karl foster (grass) it produced more roots and more foliage. See Picture #1

50% redwood shavings and 50% wood fiber

- A. Four varieties side by side, we compare our regular mix vs wood fiber and there is not a noticeable difference, plants perform the same in grow, color and rooting. The shifting was done on 03/31/26. See Pictures, left = wood fiber right= our soil mix

80% redwood shavings and 20% wood fiber

We did two varieties in 5 gls, there is no difference in grow, color or roots. Shifting was done on 03/31/26

Notes: after reviewing our trials, our conclusion is that wood fiber or wood shavings the result are very similar, can't see any advantage of it, we will continue to monitor the trials and see if there is any changes later on.
